Breast cancer

This information is about breast cancer and treatments for breast cancer. Any words that are underlined are explained in the word list at the end. The word list also includes the pronunciation of the words in English.

If you have any questions about this information, ask your doctor or nurse at the hospital where you are having treatment.

You can also call Macmillan Cancer Support on freephone 0808 808 00 00, 7 days a week, 8am to 8pm. We have interpreters, so you can speak to us in your own language. When you call us, please tell us in English which language you need (say “xxxxx”).

There is more cancer information in [LANGUAGE] at macmillan.org.uk/translations

The breasts

The breasts are made of fat and tissue. They also have glands where breast milk is made. The glands are connected to the nipple by fine tubes called milk ducts. Men have a small amount of breast tissue behind the nipple.

There is breast tissue and lymph nodes (glands) in the armpits. The lymph nodes are part of the lymphatic system. There are also lymph nodes near the breastbone and behind the collarbones.

Side view of the breast

The lymph nodes near the breasts
Breast cancer

Body tissue is made up of tiny cells. Breast cancer happens when cells in the breast grow in an uncontrolled way and form a lump called a tumour (primary cancer). Sometimes, cancer cells spread to other parts of the body through the blood and lymphatic system. This is called secondary cancer.

There are different types of breast cancer, but they are treated in similar ways. Breast cancer mainly affects women. Men can also have it, but this is rare.

Breast cancer is not infectious and cannot be passed on to other people.

Stages and grades of breast cancer
- The stage of a cancer means how big it is and if it has spread.
- The grade of a cancer is how quickly the cancer may grow.

Receptors
Some breast cancer cells have receptors that hormones or proteins can attach to. These can make the cancer grow.

- **Hormones** – some breast cancers have receptors for the hormone oestrogen. These are called oestrogen-receptor positive (ER positive) breast cancers. Treatments called hormonal therapies work well for ER positive breast cancer. Breast cancers may also have receptors for the hormone progesterone.

- **Proteins** – some breast cancers have too much of the protein HER2 on the surface of the cells. They are called HER2 positive breast cancers. Your doctor may give you trastuzumab for this type of cancer. This belongs to a group of drugs called targeted therapies.

Triple negative breast cancer
Breast cancer that does not have receptors for hormones or proteins is called triple negative breast cancer.

1 in 5 women with breast cancer (20%) have triple negative breast cancer. It is more common in younger women. Your doctor or nurse can tell you more about this.

How treatment is planned
Your healthcare team will meet to plan the best treatment for you. Your doctor or nurse will then talk to you about:
- the stage and grade of the cancer
- if the cancer has hormone or protein receptors
- your general health
- the treatments and possible side effects
- what you think about the available treatments.
Talking to your healthcare team

It is important to talk about any treatment with your doctor, so that you understand what it means. After talking with you, your doctor will usually ask you to sign a form to show that you understand and agree to the treatment. This is called giving your consent. You will not be given treatment unless you have agreed to it.

It is a good idea to take someone with you who can speak both [language] and English. Or your hospital can arrange an interpreter for you. Let your nurse know if you need one.

Questions to ask about your treatment

- What does my diagnosis mean?
- What is the stage and grade of the cancer?
- What will my treatment be?
- What are the benefits, risks and side effects of each treatment?
- Will the treatment affect my daily life?
- Who can I talk to about how I am feeling?

We have more information in your language about being diagnosed with cancer.

Treatments for breast cancer

Treatments for breast cancer include:

- an operation (surgery)
- drugs (chemotherapy, hormonal therapy, targeted therapy)
- radiotherapy.

Many people have more than one type of treatment, such as an operation and then radiotherapy. Or you may have chemotherapy before or after an operation.

An operation

An operation (surgery) to remove the cancer is a common treatment for breast cancer. The doctor removes the cancer and some healthy tissue around it. The operation you have depends on the size of the cancer, where it is in the breast and what you prefer.

The doctor may talk to you about having an operation to remove:

- the cancer (wide local excision)
- the whole breast (mastectomy).

Some people also have surgery to make a new breast shape (breast reconstruction) during the operation. Others choose to have this done at a later time. You can speak to your doctor about this and the different ways of doing it. If you do not have reconstruction, your nurse can give you an artificial breast (prosthesis) to put inside your bra.
Checking the lymph nodes
During the operation, the doctor will usually remove some lymph nodes. They remove them from under your arm on the side of the cancer. This is to check if there is cancer in the lymph nodes. This helps the doctor decide if you need more treatment. The doctor or nurse will explain how the lymph nodes are removed.

If any of the nodes contain cancer, you may be offered an operation to remove the remaining lymph nodes. Some women may have radiotherapy to the lymph nodes instead of surgery.

We have more information in [language] about how surgery is planned and what to expect after the operation.

Radiotherapy
Radiotherapy uses high-energy x-rays to destroy the cancer cells. It can damage normal cells too, but these usually repair when treatment ends.

You often have radiotherapy after an operation once the wound has healed. This can reduce the risk of the cancer coming back. After a wide local excision, you usually have radiotherapy to the remaining breast tissue. Occasionally, you may have radiotherapy after a mastectomy.

You may also have radiotherapy to the armpit to treat any remaining lymph nodes.

We have more information in [language] about radiotherapy and some of the side effects you may have.

Chemotherapy
Chemotherapy uses anti-cancer drugs to destroy cancer cells. The drugs are usually given into a vein or taken as a tablet. Having chemotherapy can reduce the risk of breast cancer coming back.

Your doctor may advise you to have chemotherapy if:

- the cancer is large
- the cancer has spread to the lymph nodes
- the cancer is a higher grade
- you have triple negative breast cancer
- you have HER2 positive breast cancer.

Some people may also have chemotherapy before surgery to shrink a cancer. This usually means a smaller operation is needed.

Chemotherapy drugs can cause side effects that make you feel unwell. Different drugs can cause different side effects, including:

- being more likely to get an infection
- feeling tired
- feeling sick or being sick
- diarrhoea or constipation
- a sore mouth
- hair loss.
Your doctor can talk to you about the side effects you may have and how to manage them. Most side effects can be controlled with drugs. Most side effects go away when chemotherapy is over.

We have more information in [language] about chemotherapy and some of the side effects you may have.

**Hormonal therapy**
If you have an oestrogen-receptor positive (ER positive) cancer you will usually have hormonal therapy. Hormonal therapies lower the level of oestrogen or stop it attaching to the cancer cells. You usually start hormonal therapy after surgery or chemotherapy and have it for a few years.

Hormonal therapy helps to reduce the risk of the breast cancer coming back. It also helps reduce the risk of getting a new breast cancer in your other breast. Sometimes hormonal therapy drugs are given before surgery to shrink a cancer and avoid a mastectomy. You may have different drugs, such as tamoxifen, letrozole or anastrozole. This depends on:

- whether you have been through the menopause
- the risk of the cancer coming back
- how the side effects are likely to affect you.

Side effects of hormonal therapy include:

- hot flushes and sweats
- joint pain
- low sex drive.

**Stopping the ovaries from working**
If you have not been through the menopause, stopping your ovaries from working is another way to lower your oestrogen levels. There are two treatments that can do this:

- ovarian suppression, which stops the ovaries making oestrogen and causes a temporary menopause
- ovarian ablation, which removes the ovaries and causes a permanent menopause.

You will usually have hormonal therapy with one of these treatments.

If you are offered either of these treatments to stop your ovaries working, your doctor will give you more information and answer any questions you may have.

If you are worried about your fertility, talk with your doctor before you start treatment.

**Trastuzumab**
If the cancer is HER2 positive, your doctor may give you trastuzumab. This belongs to a group of drugs called targeted therapies. Trastuzumab stops the HER2 protein from making the cancer cells grow. You usually have trastuzumab every three weeks for a year. It may be given with chemotherapy, or on its own. This can be before or after surgery and radiotherapy.
The side effects are usually mild, but can include:

- a headache
- a high temperature (fever) and chills
- feeling sick.

You may have trastuzumab in combination with another targeted therapy drug called pertuzumab (Perjeta®) and a chemotherapy drug. These drugs may be given before an operation if there is a high risk of the cancer coming back.

Occasionally, trastuzumab can affect the heart. You will have tests to check your heart before and during treatment.

**Bisphosphonates**

Bisphosphonates are drugs that may be used in early breast cancer to:

- help protect your bones from the effects of treatments
- reduce the risk of breast cancer coming back.

Some hormonal therapy and chemotherapy drugs can cause an early menopause, which increases the risk of bone thinning (osteoporosis). Your doctor may prescribe bisphosphonates if you are at risk of bone thinning, or if you already have thinning bones.

If you have early breast cancer, bisphosphonates can sometimes lower the risk of it spreading to the bone. You have bisphosphonates for 3 to 5 years. This treatment is usually given if you have a higher risk of the cancer coming back. Your doctor or nurse can give you more information.

**Possible side effects of your treatment**

We have more information in [language] about common side effects of chemotherapy, radiotherapy and surgery.

Here are some other side effects that you may have during and after breast cancer treatment.

**Changes to the breast**

Surgery and radiotherapy to the breast can cause changes, including:

- how the breast looks and feels
- pain in the breast and under the arm
- how much you can move the arm and shoulder on the treated side.

After an operation, there will be a scar. This will usually become less obvious over time. Stretching and massaging the scar can improve this.

After radiotherapy, the skin of your breast may be darker and more sensitive. It is important to cover the area and use sunscreen with a high Sun Protection Factor (SPF) (at least SPF 30). Ask your nurse or doctor for further advice.

If you notice changes to the appearance or feel of your breast, it is best to have them checked by your doctor or specialist nurse.
**Lymphoedema**
Lymphoedema is a swelling caused by fluid building up in the body. Some people may have this after an operation for breast cancer. It is most likely to affect an arm. The swelling can be reduced by exercise, special bandages and massage. If you have swelling in your arm or hand, tell your nurse. The earlier lymphoedema is diagnosed, the easier it is to treat.

To reduce the risk of lymphoedema:

- Look after your skin. Use a skin cream and avoid cuts or scratches.
- Keep active and exercise. This helps lymph fluid move around the body.
- Keep to a healthy weight.

**Bone changes**
Some hormonal therapies can thin the bones. Your doctor may use a scan to check your bones. After this, you may be given treatment to protect your bones.

**Concentration and memory problems**
After breast cancer treatment, you may find it harder to concentrate and remember things. This is usually mild and often gets better within a year of finishing treatment. Talk to your doctor or nurse if you are worried about this.

**Weight gain**
After breast cancer treatment, you might gain weight. This may be because of treatments like hormonal therapy or steroids. Some treatments can start the menopause which can also cause weight gain. Your nurse or doctor can give you advice about healthy eating and exercise.

**Late side effects**
Sometimes people get side effects from breast cancer treatment that occur months or years after their treatment has ended. These are called late side effects. Most people will never have late side effects.

Your doctor can tell you if your treatment for breast cancer could lead to a late side effect. They can tell you what signs and symptoms to look for and what to do if you have any worries.

**Other information**

**Contraception**
You may be advised to avoid getting pregnant for 2 years after breast cancer treatment. Your doctor will advise you not to use contraception that contains hormones, including the pill and some coils.

You can use coils that do not contain hormones and barrier contraception such as condoms or the cap. Your nurse can give you advice about this.
Hormone replacement therapy
Doctors do not recommend hormone replacement therapy (HRT) after having breast cancer. HRT contains oestrogen which could encourage breast cancer cells to grow.

But if you have severe symptoms of the menopause and nothing else has helped, your doctor may prescribe it. Your doctor will talk to you about the possible risks.

Follow up
After your treatment has finished, you may have regular check-ups and mammograms. These will be every few months at first. Eventually you may only have them once a year. Sometimes, instead of routine appointments, you will be asked to contact your specialist if there is anything you are worried about.

Your feelings
You may feel overwhelmed when you are told you have cancer. You may have many different emotions. There is no right or wrong way to feel. There are many ways to cope with this. Talking to a close friend or relative may help. Your doctor or nurse can help too.

How Macmillan can help you
Macmillan is here to help you and your family. You can get support from:

- The Macmillan Support Line (0808 808 00 00). We have interpreters, so you can speak to us in your language. Just tell us, in English, the language you want to use. We can answer medical questions, give you information about financial support, or talk to you about your feelings. The phone line is open 7 days a week, 8am to 8pm.

- The Macmillan website (macmillan.org.uk). Our site has lots of English information about cancer and living with cancer. There is more information in other languages at macmillan.org.uk/translations

- Information and support services. At an information and support service, you can talk to a cancer support specialist and get written information. Find your nearest centre at macmillan.org.uk/informationcentres or call us. Your hospital might have a centre.

- Local support groups – At a support group you can talk to other people affected by cancer. Find a group near you at macmillan.org.uk/supportgroups or call us.

- Macmillan Online Community – You can also talk to other people affected by cancer online at macmillan.org.uk/community
