High temperature or fever

There are different reasons why a person with cancer may have a high temperature or fever.

It could be a symptom of an infection. Cancer and its treatment can weaken your immune system. This can increase your risk of getting an infection. Getting an infection when your immune system is weakened can be a serious complication of treatment.

Always contact the hospital on the 24-hour contact numbers you have been given and speak to a nurse or doctor if:

- your temperature goes over 37.5°C (99.5°F)
- you suddenly feel unwell, even with a normal temperature
- you have any symptoms of an infection, such as a cold, sore throat, cough, peeing frequently (urine infection), diarrhoea, or feeling shivery and shaking.

A high temperature or fever can also be:

- a symptom of some types of cancer, such as lymphoma and mesothelioma
- a symptom of an allergic reaction to a cancer drug.

Tips for avoiding infection

Before you start treatment, follow these tips:

- Talk to your doctor or nurse about a flu vaccine.
- Have a dental check.
- Buy a thermometer, so you can check your temperature.

During treatment, follow these tips:

- Take extra care to keep your mouth clean. Your nurse will show you how to do this.
- Have good personal hygiene. Wash your hands regularly, especially after using the toilet or when preparing meals. Have a daily shower or bath, and do not share towels.
- Avoid people who are unwell, for example people with chicken pox, shingles, diarrhoea or a fever.
- Stay away from crowded places where there are likely to be people with infections. This means avoiding rush hour and crowded shopping centres.
- Drink plenty of fluids.
- Cook food properly and store it at the correct temperature. Keep raw and cooked foods apart.
- Take care when looking after animals. Try to avoid handling any animal waste.
- Avoid swimming and public jacuzzis. Do social or sports activities at quieter times when there is less risk of picking up an infection in the changing room.
